A: The correct use of AI while in college is to be an assistant, not a relied upon source to do your work. I believe it is ok to use AI to organize your thoughts, help with grammar and flow in writing, or to help find sources. However, it should not take away the originality of your work. You should still be articulating your own words and thoughts. The sources you may find through AI should still be verified and read yourself. It should be nothing more than an aid and it should be cited when used. Your work should still be a representation of what you know, and AI usage should not take away from what you are actually learning. Integrity is very important.

AI Response: Yes, I agree with your overall argument.

I especially agree with the distinction between **using AI as an assistant versus using it as a substitute for your own work**. Your examples—brainstorming, organizing thoughts, improving grammar/flow, and finding potential sources—are reasonable uses as long as you remain responsible for the final work.

The strongest part of your argument is that **AI shouldn't replace the learning process**. If AI writes the entire assignment, generates the ideas, or provides information that you never verify or understand, then you're no longer demonstrating what *you* know.

I would only slightly qualify one statement: **AI doesn't always have to be cited in the same way as a traditional source.** Citation requirements depend on the professor, assignment, and institution. But if your professor requires AI disclosure/citation, then absolutely, it should be cited.

So overall: **yes—I think your position is reasonable, academically responsible, and well-balanced.**

B: The incorrect use of AI while in college is to have AI completely write your essay for you. This shows no understanding of the concept you are writing about. It shows no skill in your writing and does not allow for you to be properly assessed. It is wrong to use AI for homework or quizzes because you show no understanding of the material. It is no longer using it as an aid but simply cheating. You are not having to think or learn because you are not using AI as an aid but relying on it to do the thinking for you. This is very damaging because you are not properly learning the material and no longer possess the integrity of your original thoughts, ideas, and knowledge.

AI Response: Yes, I agree with B.

I think your strongest point is that **using AI to complete work that is supposed to measure your own knowledge defeats the purpose of the assignment**. If a student has AI write an essay, answer homework questions, or complete a quiz for them, the professor is no longer seeing what that student understands.

I also agree with your distinction between **assistance and replacement**:

- **AI as an aid:** helping brainstorm, organize, proofread, explain a difficult concept, etc.
- **AI as a replacement:** writing the assignment, answering the questions, or doing the thinking for you.

The only thing I'd slightly change is saying that using AI for homework or quizzes is *always* wrong. That depends on the professor's rules—some instructors explicitly allow AI for certain assignments. Your stronger argument is that **using AI to complete work when you are expected to demonstrate your own understanding is academically dishonest**.

That also connects really well with your answer to A, because both answers are built around the same principle: **AI can support your learning, but it shouldn't replace it.**
